Maintenance Task Data Base for Buildings: Plumbing Systems

by
Edgar S. Neely
Robert D. Neathammer
James R. Stirn
Robert P. Winkler

This research project has provided improved maintenance resource data for use during facility planning, design, and maintenance activities. Data bases and computer systems have been developed to assist planners in preparing DD Form 1391 documentation, designers in life-cycle cost component selection, and maintainers in resource planning. The data bases and computer systems are being used by U.S. Army Corps of Engineers (USACE) designers at the District and installation levels and by resource programmers at USACE Headquarters, and Army Major Commands and installations. These research products may also be useful to other Government agencies and the private sector.

This report describes the building task maintenance and repair data base development and gives examples of its application. It is one of a series of special reports on the maintenance and repair data base. While this report describes plumbing systems, other reports in the series cover heating, ventilation, and air-conditioning systems, electrical systems, and architectural systems.

Approved for public release; distribution is unlimited.

FOREWORD

This research was conducted for the Directorate of Military Programs, Headquarters, U.S. Army Corps of Engineers (HQUSACE) and the Office of the Assistant Chief of Engineers under various research, development, testing, and evaluation (RDTE) and reimbursable funding documents. Work began under RDTE in 1980 and continued in reimbursable projects during 1984 through 1989. The technical monitor for the RDTE part was Dr. Larry Schindler (CEMP-EC) and for the reimbursable part was Ms. Val Corbridge (DAEN-ZCF-R).

The work was performed by the Facility Systems Division (FS), U.S. Army Construction Engineering Research Laboratory (USACERL). The Principal Investigators were Dr. Edgar Neely and Mr. Robert Neathammer (USACERL-FS). The primary contractor for much of the data development was the Department of Architectural Engineering, Pennsylvania State University. Dr. Michael O'Connor is Chief of USACERL-FS.

COL Everett R. Thomas is Commander and Director of USACERL, and Dr. L.R. Shaffer is Technical Director.

MAINTENANCE TASK DATA BASE FOR BUILDINGS: PLUMBING SYSTEMS

1 INTRODUCTION

Background

Maintenance* and repair (M&R) cost estimates are needed during planning, design, and operations/maintenance of Army facilities. During planning, life-cycle costs are needed to evaluate alternative ways of meeting requirements (e.g., lease, new construction, renovate existing facilities). During design, M&R requirements for various types of components, such as built-up or shingle roofs, are needed so that the total life-cycle cost of different designs can be minimized. Finally, once the facility has been constructed, outyear predictions of maintenance and repair costs are needed so that enough funds can be programmed to ensure that Army facilities are maintained properly and do not deteriorate due to lack of maintenance.

The Directorate of Engineering and Construction (EC), Headquarters, U.S. Army Corps of Engineers (HQUSACE),** asked the U.S. Army Construction Engineering Research Laboratory (USACERL) to coordinate the assembly of a single centralized maintenance and repair data base for use by Corps designers. This research was required because designers were not able to obtain reliable maintenance and repair data to support their life-cycle cost (LCC) analysis from installations or from the technical literature. One of the first tasks in the research effort was to determine if reliable data bases, which could be adapted for Corps use, existed in government or private industry. Comprehensive data bases of maintenance costs for government and private sector facilities did not exist. The little data available always depended on widely varying standards of maintenance used to maintain the facilities for which the data was collected and thus was unreliable for prediction purposes. Recognizing this, HQUSACE asked USACERL to develop a maintenance and repair cost data base. This data is for use by U.S. Army Corps of Engineers (USACE) designers in performing life-cycle cost analyses during the design of new facilities. Initial results were presented in several USACERL reports.¹

Soon after this request, the Facilities Programming and Budgeting Branch of the Facilities Engineering Directorate asked USACERL to develop prediction models for outyear maintenance requirements of the Army facility inventory. The Programming Office of EC, responsible for Military Construction, Army (MCA) planning, also requested that USACERL provide methods and automated tools to help installations perform economic analyses. Part of the objective was to allow analysis to obtain future maintenance cost data.

*Maintenance in this report means all work required to keep a facility in good operating condition; it includes all maintenance, repair, and replacement of components required over the life of a facility.

**At the time of this request, EC was part of the Office of the Chief of Engineers, which has since reorganized. In addition, EC has now become the Directorate of Military Programs.

¹ R.D. Neathammer, *Life-Cycle Cost Database Design and Sample Cost Data Development*, Interim Report P-120/ADA0997222 (U.S. Army Construction Engineering Research Laboratory [USACERL], February 1981); R.D. Neathammer, *Life-Cycle Cost Database: Vol I, Design*, and *Vol II, Sample Data Development*, Technical Report P-139/ADA126644 and ADA126645 (USACERL, January 1983), Appendices E through G.

In response to these requests, USACERL began a multiyear effort to develop a comprehensive maintenance and repair cost research program for buildings. This coordinated program is the key to all detailed estimation of future maintenance costs for Army facilities.

Research Performed and Reports Published

This is one of several interrelated reports addressing maintenance resource prediction in the facility life-cycle process. The total research effort is described in a USACERL Technical Report.²

The first research product was a data base containing maintenance tasks related to every building construction component. This data base provides labor, material, and equipment resource information. The frequency of task occurrence is also included. This information is published in a series of four USACERL Special Reports by engineering systems: (1) architectural, (2) heating, ventilating, and air-conditioning (HVAC), (3) plumbing, and (4) electrical. The title for the series is *Maintenance Task Data Base for Buildings*.³ Table 1 shows an example from this data base. This data is also available in electronic form. The data base is used in a personal computer (PC) system under the Disk Operating System (DOS). This computer program allows a facility to be defined by entering the components and component quantities comprising the facility. The tasks are used to determine the resources required annually to keep the facility maintained.

The second research product was a component resource summary for the first 25 years of a facility. The tasks for the component were scheduled and combined into one set of annual resource requirements. This annual resource information is published in a series of four USACERL Special Reports titled *Building Component Maintenance and Repair Data Base*.⁴ An example from this data base is shown in Table 2. The data base is also available in electronic form. This data can be used to perform special economic analyses such as one for a 20-year life using a 10 percent discount rate.

The third research product was a set of 25-year present worth factor tables for use by designers in selecting components for discount rates of 7 and 10 percent. The annual component resource values were multiplied by the appropriate present worth factor and added for the 25 years to produce one set of resource values. This information is published in a series of four USACERL Special Reports titled

*Building Maintenance and Repair Data for Life-Cycle Cost Analyses.*⁵ Table 3 shows an example from this data base. The data base is also available in electronic form. The first three resource columns provide data to allow designers to calculate the life-cycle costs at any location by multiplying by the correct labor rate, equipment rate, and material geographic factor. The multiplication and addition have been performed for the Military District of Washington, DC, and results are given in the fourth column of the table. The right section of the table is information that can be entered into computer systems that perform life-cycle cost analysis.

See NOTES on the last page of this table for Explanation of Column Headings

A fourth research product was a PC system that allows facilities to be modeled by entering the components that comprise the facility. Future years resource predictions are produced by applying the individual tasks and then forming resource summaries by subsystems, systems, facilities, installations, reporting installations, Major Commands (MACOMS) and Army. A summary level computer system was also developed for use by the Department of the Army (DA) and MACOMS. The summary level system applies the most basic data contained in the current facility real property inventory files: (1) current facility use, (2) floor area, and (3) construction date. User's and system's manuals will be published as USACERL ADP Reports.

Objective

The objective of this report is to describe the component summaries for plumbing systems and give examples for using these tables in performing life-cycle cost analyses during the design process.

Approach

The first activity in the research was to survey the literature for available maintenance data. No comprehensive task resource data base was located. The Navy has developed a series of manuals dealing with labor hours required to perform several basic maintenance tasks. This work has been adopted by the Department of Defense (DOD) for tri-service use. A series of Technical Bulletins (TBs) under the general title *Engineered Performance Standards* (EPS) has been published.

The next activity was to survey USACE District offices to solicit their input for a data base. A guiding committee composed of District personnel, installation representatives, and private sector consultants met and agreed upon a general data base design. More importantly, they recommended that the data base be developed using the EPS rather than historical data.

Once the data base was developed, component summaries were created by summing all tasks for a component. These summaries were then input into a program that computed present worth values for each component.

The calculation procedures described in this report were performed and summarized for standard Army life-cycle analysis of 25 years with a 7 or 10 percent worth factor. Final results are published in the USACERL Special report series *Building Maintenance and Repair Data Base for Life-Cycle Cost Analyses*.

Scope

The 25-year component resource summary tables are for DOD designers and can also be used by those in the private sector.

Mode of Technology Transfer

The tables pertinent to designer use will be issued as a supplement to Technical Manual (TM) 5-802-1, *Economic Studies for Military Construction Design—Applications*.

2 PROBLEM DEFINITION

In the facility life-cycle process, costs are incurred in construction, operation, maintenance, and disposal of a facility. Past emphasis during the planning, design, and construction phases has been on estimating initial construction costs. The impact of operating and maintaining facilities has always been a secondary consideration. In many cases, the operation and maintenance (O&M) costs are far greater than initial construction costs. Building owners are concerned with the total ownership costs of facilities rather than just the initial construction costs.

The Army has realized the importance of performing total life-cycle cost analyses for facilities at the design stage of accurately forecasting these costs for funds programming. HQUSACE asked USACERL in 1980 to develop a method of estimating future maintenance costs for buildings. In 1982, the programming branch of the former Facilities Engineering Directorate asked USACERL to develop effective models for forecasting facility maintenance resource requirements based on the actual facility.

Life cycle cost economic studies are an integral part of facility design in the MCA program. Requirements for performing these studies are given in:

- Statutes, Code of Federal Regulations, and Executive Orders for performing analyses when energy is a key cost and for wastewater treatment plants
- USACE *Architectural and Engineering Instructions: Design Criteria*
- Army Regulation (AR) 11-28, *Economic Analysis and Program Evaluation for Resource Management* for general economic analyses
- TM 5-802-1, *Economic Studies for Military Construction Design--Applications*

The main purpose of these studies is to minimize the life-cycle costs of Army facilities.

To perform life-cycle cost analyses on facility designs, three categories of costs are needed: initial, operating, and maintenance. Initial costs are usually easy to estimate through existing cost estimating systems such as the Corps of Engineers Computer Assisted Cost Estimating System (CACES) and standard publications such as Means or Dodge. Operating costs can be estimated by using energy consumption models such as the Corps of Engineers Building Loads Analysis and System Thermodynamics (BLAST) program or the Trane Company's Trace program. However, accurate estimates of maintenance costs are not available.

There are no comprehensive data bases of maintenance costs for building components either in the private sector or State/Federal Governments. Some historical data is available from the Building Owners' and Managers' Association reports. Within the Army, the Integrated Facilities System (IFS) contains some historical data; however, it does not have a feature for retaining several types of a building component (e.g., having brick and wood exteriors or three types of floor covering). Moreover, the data in IFS has not been kept current. For example, at one installation several family housing units were shown as having wood siding when, in fact, they had been covered with aluminum siding several years earlier.

3 DATA BASE DEVELOPMENT

The first step in data base development was to subdivide a building into systems, subsystems, and components, and define maintenance tasks. The second step was to schedule each task and to estimate resources for each task.

Building Subdivision

The UNIFORMAT method of dividing a building into systems, subsystems, and components was adopted since it is used by most Federal agencies and many private organizations. Systems requiring little maintenance such as foundations and superstructure were not subdivided.

The level of component detail was determined by maintenance and design personnel. This level varied, depending on the facility classification (e.g., historical) and the costs to collect and maintain data versus the benefit. Appendix A contains a complete list of the subdivisions. Major plumbing categories are:

08	Plumbing
081	Sanitary Fixtures
082	Rain Water
083	Special Plumbing Systems
084	Special Plumbing Fixtures.

Task Development

The primary objective was to develop a data base that is neither time- or cost-dependent. A data base independent of time would also be unaffected by inflation. This condition was achieved for labor and equipment resources through the use of hours. The number of labor hours and equipment hours for a task depends only on the current rates when an LCCA is performed. This process was not possible for material costs.

A typical task data form is shown in Table 1. The EPS adopted by all DOD agencies were used to determine labor resources. A USACERL Technical Report contains a full explanation of use of EPS in developing these resources.⁶

Standard references such as DA criteria documents, Corps of Engineers Unit Price Manuals, Means, and Dodge were used to determine the Washington, DC, area material costs. Material costs in the data base are given in July 1985 dollars for this area. Material costs can be adjusted for site location by applying a geographic location adjustment factor similar to the values shown in Appendix B. Material costs can be adjusted for inflation by applying a time adjustment factor from July 1985 to the new point in time.

⁶ E.S. Neely, et al., TR P-91/10, (USACERL, March 1991).

Task frequencies are the most subjective portion of the data base and were determined by applying professional experience, trade publication data, and data in manufacturers' literature. A range of values is given to provide more information than one average frequency.

The first activity was to list all maintenance tasks that occur during the life of each component. The next step was to develop resource data for each task. The five sets of elements shown in Figure 1 were needed for developing each task: (1) unit of measure, (2) frequency of occurrence, (3) labor hours, (4) equipment hours, and (5) material costs.

1. Unit of measure. A standard unit of measure for each component was selected based on commonly accepted measurement methods, the measurement units used within IFS, and the level of detail supported by the maintenance personnel. The standard unit of measure was one fixture.

2. Frequency of occurrence. The frequency of occurrence for tasks is the most subjective element in the data base. The data base developers used their experience and information from journals, reports, and manufacturers to estimate task frequencies.

3. Labor hours. The primary source of labor requirements was the EPS, which are approved for use by all DOD agencies. EPS are based on either methods-time-measurement studies or work sampling studies. Using these techniques, times for performing subtasks were estimated and combined to provide total task times.

The following EPS sources were used:

- TB 420-20, *Plumbing and Pipefitting Handbook* (August 1983)
- TB 420-34, *Preventive/Recurring Maintenance Handbook* (March 1984)
- TB 420-30, *Emergency/Service Handbook* (August 1979)
- TB 420-12, *Machine Shop, Machine Repairs Handbook* (April 1983).

When information was not available within EPS, the data was developed from existing trade journals, reports, and other publications.

4. Material resources. The amounts of materials needed were normally based on EPS and contractor experience. Material costs were taken from CACES, Means, Dodge, and other references.

5. Equipment resources. The equipment hours required for maintenance trucks were developed by dividing the total labor hours for the task by the normal crew size used on the task.

The data base has been reviewed by 13 different maintenance organizations and has been determined to accurately represent the resources required to perform the tasks.

Component Index

Appendix A lists all systems, subsystems, and components in the data base.

Appendix B gives geographical location adjustment factors.

Detailed Task Tables

Appendix C gives detailed resources by subtask for each task.

Summary Task Tables

Appendix D contains summary data from Appendix C. The half page per task given in Appendix C has been summarized into one line in Appendix D. This data includes the CACES number, task description, unit of measure, trade code, task classification (major or minor), the average, high, and low frequencies of task occurrence, labor hours, material costs, and equipment hours.

4 DATA BASE APPLICATION EXAMPLES

The task information can be used to calculate resources to perform the tasks for programming, planning, and staffing. These detailed task tables normally should not be used in performing life-cycle cost analyses. Tables given in the USACERL Special Report series *Building Maintenance and Repair Data for Life-Cycle Cost Analysis* are more appropriate for standard 25-year life-cycle cost analysis using either 7 or 10 percent discount rates. Tables in the USACERL Special Report series *Building Component Maintenance and Repair Data Base* can be used for other life-cycle cost analyses.

The example below calculates the cost of replacing a washer in the ball-cock of 100 water closets, given the following information:

Number of fixtures	100
Labor rate	\$18.50/hr
Geographic location factor	1.05
Equipment rate	\$3.60/hr
Washer Cost	\$0.17

Task data for this example is shown in Table 1. The calculation is: (Labor hr/fixture x Labor rate \$/hr + Material cost in Washington, DC dollars/fixture x Geographic location factor + Equipment rate \$/hr) x number fixtures. Substituting the above data:

$$\begin{aligned} & (.18720 \text{ hr/fixture} \times \$18.50/\text{hr} + \$0.17 \times 1.05 + .18720 \text{ hr/fixture} \times \$3.60 \\ & = \$.592212/\text{fixture}) \times 100 \text{ fixtures} = \$59.23. \end{aligned}$$

5 PROCEDURES FOR DEVELOPING TASKS

Procedures for developing a task can be demonstrated by using the existing task number 0811202, REPLACE WASHER IN BALL COCK OF WATER CLOSET, shown in Table 1. The task includes turning valve off and on; removing and installing rod lifter, valve, and washer; grinding valve seat; and checking operation.

All labor hours were taken from the Pipefitting and Plumbing Handbook, TB-420-20, Table QT-314, page 183, shown in Table 4.

Labor hours for turning the water valve on and off are in subtask 1. The time used is .00846, hours/job or .008.

Labor hours for removing and installing the tank cover are in subtask 2. The time used is .01726 hours/job or .01700.

Labor hours for removing and installing two screws are in subtask 3. The time used is .03508 hours/job or .03500.

Labor hours for removing and installing valve rod lifter are in subtask 4. The time used is .00396 hours/job or .00400.

Labor hours for removing and installing valve rod are in subtask 5. The time used is .00396 hours/job or .00400.

Labor hours for removing the damaged washer are in subtask 6. The time used is .02252 hours/job or .02300.

Labor hours for installing the new washer are in subtask 7. The time used is .01265 hours/job or .01300.

Labor hours for grinding the valve seat are in subtask 8. The time used is .01627 hours/job or .01600.

Labor hours for checking operation of the reassembled water closet are in subtask 9. The time used is .02400 hours/job.

The total direct labor hours to perform the entire job would be the sum of all subtasks, or .144000 hr/job. The indirect time or the time to plan the work, load the truck at the beginning of the day, unload the truck at the end of the day, personal time, delay time, and material handling time must be included to obtain the total onsite labor time. In EPS, this value is expressed as a percentage of the direct labor. When all factors have been considered, the direct labor should be increased by 30 percent or .043200 hr/job.

The steering committee wanted to apply the same material costs for all planning, programming, design, construction, and operations activities. For this research project, all material costs were developed using prices in the Washington, DC area. Material prices for exact locations throughout the world can be obtained by multiplying the Washington, DC area costs by the appropriate location adjustment factor

published in a Programming, Administration, and Execution System (PAX) Newsletter under the title "Area Cost Factor Indexes." A copy of the 22 September 1988 indexes are given in Appendix D, Geographical Location Adjustment Factors. The *CACES Unit Price Book* for Region II, dated July 1, 1985 has been used for all costs and can be obtained from the Corps District Cost Estimating Section.

In reviewing material prices, there will usually be many grades listed for the component in question. Since only one entry for the component task will be made for the maintenance data base, it is important to use the middle grade for pricing. This will produce an average material cost.

When materials are not given in the CACES manuals, other material pricing manuals, such as Means, should be used to determine the cost.

The material cost for washers is obtained from local plumbing vendors and was quoted at \$.17/washer.

Table 4
Task QT-314*

No.	Reference	Work Unit Description	Hours	Units
1	PWQ-14-IV	Turn valve on and off	.00846	Job
2	PWMU-1-8012	Remove and install cover	.01726	Job
3	PWMU-1-8000	Remove and install two screws	.03508	Job
4	PWMU-1-8005	Remove and install valve rod lifter	.00396	Job
5	PWMU-1-8005	Remove and install valve rod	.00396	Job
6	PWMU-1-8013	Remove washer	.02252	Job
7	PWMU-1-8010	Install washer	.01265	Job
8	PWMU-1-8026	Grind valve seat	.01627	Job
9	4201	Check operation	.02400	Job

* QT-314 = .14416 hr/job.

APPENDIX C:

TASK DATA BASE DETAILED RESOURCE TABLES

TASK DATA FORM

Task Code: 0811101

Component: TANK-LESS WATER CLOSET System: SANITARY Subsystem: FIXTURES
 Task Description: M/R REPLACE FLUSH VALVE
 Unit of Measure: COUNT Frequency of Occurrence: H: 8.00 A: 10.00 L: 12.00
 Persons per Team: 1 Task Duration: 0.1105 hours Once every (H,A,L) years
 Trade: PLUMBING Task Classification: 0

Labor Resources

Subtask Description	Labor Hrs
1.TURN VALVE OFF/ON	0.008000
2.REMOVE/REPLACE PACKING NUTS	0.042000
3.REMOVE/REPLACE FLUSH VALVE	0.025000
4.CHECK FOR LEAKS	0.010000

Material Resources

Description	Quantity	Unit Cost
FLUSH VALVE	1	11.3000
		11.3000

SUMMARY

Resources UOM	Direct	Indirect	Total
Labor Hours	0.085000	0.025500	0.110500
Material Cost \$	11.300000		11.300000
Equipment Hours			0.110500

Components In This Task: 0811100

TASK DATA FORM

Task Code: 0811102

Component: TANK-LESS WATER CLOSET System: SANITARY Subsystem: FIXTURES
 Task Description: M/R UNPLUG CLOGGED LINE
 Unit of Measure: COUNT Frequency of Occurrence: H: 3.00 A: 5.00 L: 7.00
 Persons per Team: 1 Task Duration: 1.5821 hours Once every (H,A,L) years
 Trade: PLUMBING Task Classification: 0

Labor Resources

Subtask Description	Labor Hrs
1.TURN VALVE OFF AND ON	0.008000
2.REMOVE PACKING NUTS	0.109000
3.REMOVE/INSTALL NUTS FROM BOLTS	0.070000
4.REMOVE BOWL FROM FLANGE/INSTALL	0.194000
5.REMOVE GASKET	0.009000
6.UNPLUG LINE	0.150000
7.INSTALL GASKET	0.023000
8.APPLY PUTTY	0.132000
9.CLEAN PUTTY/BOWL FOUNDATION	0.136000
10.CONNECT PACKING NUTS	0.115000
11.CHECK OPERATION	0.167000
12.MOVE MATERIAL	0.104000

Material Resources

Description	Quantity	Unit Cost
PUTTY	6 oz	0.2200
		1.3200

SUMMARY

Components In This Task: 0831120

TASK DATA FORM

Task Code: 0831131

Component: GAS COMPRESSOR 7 1/2 HP System: SPECIAL PLUMBING Subsystem: COMPRESSED AIR SYSTEMS
 Task Description: PM CHECK AND ADJUST
 Unit of Measure: COUNT Frequency of Occurrence: M: 1.00 A: 1.00 L: 1.00
 Persons per Team: 1 Task Duration: 1.4690 hours Once every (M,A,L) years
 Trade: PLUMBING Task Classification: 0

Labor Resources

Subtask Description	Labor Hrs
1.CHECK COMPRESSOR OIL LEVEL	0.017000
2.CHECK TENSION ON V-BELT	0.029000
3.REPLACE V-BELT	0.245000
4.DRAIN MOISTURE FROM AIR TANK	0.025000
5.CLEAN AIR INTAKE FILTER ON COMP	0.136000
6.CLEAN RESUABLE OIL FILTER	0.139000
7.CHECK OPERATION OF PRESS. VALVE	0.083000
8.CLEAN COOLING FINS	0.081000
9.CHECK MOTOR	0.046000
10.CHECK COMPRESSOR CIRCUITS	0.139000
11.PERFORM OPERATION	0.173000
12.FILL OUT MAINTENANCE REPORT	0.017000
